## TRICK YOUR TASTE BUDS

*Taste is sensed by taste buds on your tongue. But the brain looks at a lot more information than just what's coming in from the taste buds when it determines something's flavor. Alter other sensory input in this experiment to see if you can trick your taste buds.*

### MATERIALS

- Blindfolds
- Plates
- Pieces of any bland food, like jicama or crackers.
- 3–5 scent samples (examples: vanilla extract, peppermint, peanut butter\*, cinnamon, lemon peel, coffee, etc.) \*Make sure participants are not allergic to any foods or scents you're using
- Science notebook or paper
- Something to write with

### PROCEDURE

- Prepare a plate of 6–10 pieces of bland tasting food, 3–5 scent samples and a blindfold.
- Put on the blindfold to help focus your sense of taste and smell.
- Pinch your nose and taste 1 bite of bland food. Note the flavor.
- This time instead of holding your nose, have a partner hold one of the sample scents under your nose for you to smell while you eat the next bite. Note the difference in flavor.
- Repeat with all scents and then switch with your partner.
- What did you discover about the relationship between taste and smell? Why might your sense of taste seem weaker when you have a cold?

### DID YOU KNOW

What we call 'flavor' in the food we eat is actually the brain interpreting a mixture of sensations: smell, texture and taste. About 70–75% of what we interpret as flavor actually comes from our sense of smell. Our taste buds can interpret only 5 basic tastes: bitter, sweet, salty sour, and umami (or savory). A person's sense of taste can often be confused by comments or suggestions of other people or by mixed signals sent to the brain. For example, if you tried jicama, you may have mistaken it for an apple, because they look and feel similar to one another.

vanilla

peppermint

peanut butter

cinnamon

lemon peel

coffee

## TRICK YOUR TASTE BUDS

### K-2 GRADE EXPLORATION

- Animals and people gather information from their environments through their senses. They use this information to help them survive. In your science notebook, write or draw some ideas of how your sense of taste can help keep you healthy and safe.
- Make a list in your science notebook of as many of your senses as you can think of. Give an example for each sense of something that it can do to help you stay healthy and safe.
- Which of your senses play a part in how you experience eating a meal? Make a list of all the ways your senses are involved in eating.
- Try changing the way food looks by adding food coloring, or arranging it in different shapes to see. Does it change how much you like the food?
