

# CURIOSITY AT HOME

## USE THE FORCE(S)!

### MATERIALS

- One ball (any size)
- Any available objects to get the ball moving
- Paper or your science notebook
- Pencil

### PROCEDURE

- Get the ball rolling! Experiment with different techniques to get the ball started, without pushing it with your body or another solid object.
- Build a course to keep your ball rolling as long as possible, while only being moved by invisible forces!

#### Suggestions to get you started:

- Engineer a ramp to create potential energy with the ball and the force of gravity.
- Try blowing on the ball. Can you use or create a tool to help direct your air more forcefully on the ball? Can you have air move your ball in a different way?
- Can you use vibrations to move your ball? Try jumping around your ball to shake or vibrate the ground. What surfaces might vibrate more, better moving your ball?
- Can liquids push your ball? Does your ball float? How could you make the liquid move, so it pushes or pulls the ball?
- Will magnets move your ball?

What other ways can you think of to move it? Get creative!

### TRY THIS

- Which invisible force makes your ball move the fastest?
- How far can you make your ball move? Measure it!
- Does using a different size or weight ball change how the forces work on it?
- Can you combine methods to make it move farther or faster?
- Can you create another challenge for yourself?

## USE THE FORCE(S)!

### DID YOU KNOW?

A force can be described as a push or a pull which moves an object. Invisible forces such as gravity and electro-magnetism are at work both here on Earth and in space. Gravity keeps people and objects from floating off the surface of the Earth, and is also the force which keeps our Earth and other planets orbiting around the Sun! It is such an important force that human bodies are adapted to the Earth's gravity we experience all the time. Astronauts on the International Space Station are studying the effects of spending time in space with very little gravity (called a microgravity environment), to learn how to prepare human bodies for long term space missions.

## USE THE FORCE(S)!

### 6–8 GRADE EXPLORATION

- Explore the following questions and write your observations in your science notebook.
- Make a prediction- will a heavier ball or a lighter ball hit the ground first when dropped from the same height? Write your prediction in your science notebook, test it, and write your results!
- A Rube Goldberg Machine is a complex machine to get a simple task done. These machines use many forces to make things move and stop moving
- Watch a Rube Goldberg video:

<https://www.youtube.com/watch?v=Av07QiqmsoA>

As you watch, answer the following questions:

- ◇ What forces are being used in this video? Are any forces used more than others?
- ◇ What was done to make objects in the video move faster or slower?
- ◇ Did you find an example where the same object changed speed? Why did it speed up or slow down?
- ◇ How did they change the direction of a moving object?
- ◇ Try making your own Rube Goldberg machine to solve a simple problem using forces!
